My dear friend

The question about the *Rhinoceros Mercki* and the *Rh. bicornis* was the first work after I arrive in my collection and I found that you are right. The teeth and lower jaw, which I have described and figured are a little larger as the teeth and skull of my *Rhinoceros bicornis seu africanus*, but I could not find another differences.

I send you the moulds of 5 upper teeth all found in the neighborhood of Heidelberg; the lower tooth is found in Wurtemberg and another lower tooth near Frankfurt and was in the collection of Mr Merck. (ancienne collection)

By my self I have formed my Genus *Agnotherium*  
I send to you the forme. The tooth canine does not  
belong to this Genus and is too fragile to be formed.  
With the next time I send the other things because  
my Italian formatore is not at home.

In the next time I send you all the other things, which I promised to you.

Now my dear friend I beg you to give my best compliments to your lady and son.

I am your truly Kaup  
Darmstadt the 28 July 1858.

Your Paris Cement for fixing bones is nothing more as Plaster with Gummi arabique.

Take Gummi arabique fluide and mixe your plaster with its and you find that this secret is very simple for deschiffering.

I found in this poudre after a chemical analyse only this two substances.

A little box I pay one Frs and the volcur of the two substances is about 1/2 Louis.
